

**INTERNSHIP AS
BACKEND ENGINEER**

AN INTERNSHIP REPORT

Submitted by

Shaikh Md Zaid

220140107065

In partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

In

Department of Computer Engineering

**Government Engineering College Bharuch
Gujarat Technological University, Ahmedabad**

May, 2026

GUJARAT TECHNOLOGICAL UNIVERSITY

CERTIFICATE FOR COMPLETION OF ALL ACTIVITIES AT ONLINE PROJECT PORTAL

B.E. SEMESTER VIII, ACADEMIC YEAR 2025-2026

Date of certificate generation : 14 May 2026 (19:10:43)

This is to certify that, *Shaikh Mohammed Zaid Zubed Akhtar* (Enrolment Number - 220140107065) working on project entitled with *Credential Manager* from *Computer Engineering* department of **GOVERNMENT ENGINEERING COLLEGE, BHARUCH** had submitted following details at online project portal.

Internship Project Report	Completed
---------------------------	-----------

Name of Student : Shaikh Mohammed Zaid
Zubed Akhtar

Name of Guide : HOD_014_07

Signature of Student : _____

*Signature of Guide : _____

Disclaimer :

This is a computer generated copy and does not indicate that your data has been evaluated. This is the receipt that GTU has received a copy of the data that you have uploaded and submitted as your project work.

*Guide has to sign the certificate, Only if all above activities has been Completed.

Government Engineering College Bharuch

Bharuch – 392001, Gujarat, India

CERTIFICATE

This is to certify that the internship report submitted along with the project entitled **Credential Manager** has been carried out by **Shaikh Md Zaid** under my guidance in partial fulfillment for the degree of Bachelor of Engineering in Computer Engineering, 8th Semester of Gujarat Technological University, Ahmedabad during the academic year 2025–26.

Prof. Namarata Shroff
Head of the Department

DATE-14/04/2026

INTERNSHIP COMPLETION CERTIFICATE

This is to certify that Shaikh MD Zaid has successfully completed their internship with KYNoby Ltd for a duration of three (3) months, from 13th January 2026 to 14th April 2026.

During this period, they were associated with the Development department and were involved in tasks related to IT and Software development

We found Shaikh to be sincere, dedicated, and professional in their approach to work. They demonstrated a willingness to learn and contributed positively to the team.

We wish them every success in their future academic and professional endeavors.

Yours faithfully,

Farhan Ali

Farhan Ali

CSO and People Lead

Kynoby Limited

Government Engineering College Bharuch

Bharuch – 392001, Gujarat, India

DECLARATION

I hereby declare that the Internship report submitted along with the Internship entitled **Credential Manager System – Backend Engineering Internship** submitted in partial fulfillment for the degree of Bachelor of Engineering in Computer Engineering to Gujarat Technological University, Ahmedabad is a Bonafide record of original project work carried out by me at **KYNOBY AI** under the supervision of the internal guide and that no part of this report has been directly copied from any student's report or taken from any other source without providing due reference.

Name of the Student
Shaikh Md Zaid

Sign of Student

ACKNOWLEDGEMENT

In the successful accomplishment of this internship project, many people have bestowed upon me their blessings and wholehearted support. I take this opportunity to sincerely thank each and every individual who contributed – directly or indirectly – to the fruition of this work.

I would like to express my sincere gratitude to **KYNOBY AI** for providing me with the opportunity to work as a **Backend Engineer Intern**. The organization's focus on building scalable and secure backend systems allowed me to gain practical exposure to real-world software engineering challenges.

I am deeply thankful to my **Internal guide** and team members at **KYNOBY AI** for their constant guidance, technical support, and valuable feedback throughout the internship. Their insights into backend architecture, API design, and system optimization played a crucial role in shaping my learning experience.

I would also like to thank our esteemed Head of the Department, **Prof. Namarata Shroff**, whose constant encouragement, academic inspiration, and constructive suggestions greatly shaped both the direction and the depth of this report. Her vision for bridging theoretical education with industry application has been a guiding principle throughout my undergraduate studies.

I would like to acknowledge the broader faculty of the **Department of Computer Engineering, Government Engineering College Bharuch**, whose rigorous academic curriculum provided the foundational knowledge that made this internship possible. The courses in data structures, algorithms, statistics, and database management systems directly contributed to my ability to navigate the challenges encountered during the project.

I extend my heartfelt thanks to my **parents and friends** whose unwavering moral support, patience, and encouragement sustained me throughout the duration of this internship. Their belief in my abilities was, and continues to be, one of my greatest sources of motivation.

Finally, I am grateful to **Gujarat Technological University** for designing a curriculum that mandates industry internships as a component of the Bachelor of Engineering programme. This structural commitment to experiential learning ensures that students graduate not merely with theoretical knowledge, but with the practical competence and professional discipline demanded by the industry.

ABSTRACT

*This internship at **KYNOBY AI** provided hands-on experience in **backend system design, API development, and secure credential management**. The primary project undertaken during this internship was the development of a **Credential Manager System**, designed to securely store, manage, and assign credentials across multiple users and instances.*

The system was built using a robust backend architecture that focused on scalability, security, and modularity. Core functionalities included credential creation, assignment management, password updates, audit logging, and role-based access control. The system ensured that sensitive data such as passwords were encrypted and never exposed through API responses.

*The backend was developed using modern frameworks and followed **RESTful API** design principles. Multiple endpoints were created to handle credential lifecycle operations, **including creation, deletion, assignment, reassignment, and audit tracking**.*

A key highlight of the system was the implementation of strict constraints such as one-to-one credential assignment and instance-based access control. Additionally, audit logs were maintained to track all critical operations, ensuring accountability and traceability.

This internship enhanced my understanding of backend engineering concepts such as database design, API structuring, security best practices, and real-world system constraints. The project demonstrated how backend systems play a crucial role in maintaining data integrity and enabling secure access management in enterprise environments

INTRODUCTION

ABOUT THE COMPANY

Figure 1.1: Company Logo – KYNoby

KYNoby AI is a healthcare-focused technology organization that develops intelligent, AI-driven solutions to improve the efficiency, accuracy, and accessibility of healthcare systems. The company leverages artificial intelligence, data analytics, and modern backend architectures to build scalable platforms that assist healthcare providers, patients, and institutions in managing medical data and workflows effectively.

KYNoby AI works on building secure and reliable healthcare systems such as digital health platforms, automated medical processing tools, and intelligent decision-support systems. A strong emphasis is placed on **data security, privacy, and compliance**, ensuring that sensitive healthcare information is handled with the highest level of protection.

During my internship as a **Backend Engineer**, I contributed to the development of backend systems that supported secure credential management and access control, which are critical components in healthcare applications. This experience helped me understand how backend systems play a vital role in maintaining data integrity, system reliability, and secure access in healthcare environments.

The organization promotes innovation, problem-solving, and real-world application of technology, enabling interns to work on meaningful projects that directly impact healthcare solutions.

.

MISSION AND VISION

The **Mission** of KYNOBY AI is to enhance healthcare systems through intelligent, AI-powered solutions that improve patient care, streamline medical workflows, and ensure secure management of healthcare data. The company aims to build scalable and reliable systems that empower healthcare providers with accurate insights and efficient tools.

The **Vision** of KYNOBY AI is to become a leading innovator in AI-based healthcare technology by delivering impactful solutions that transform the way healthcare services are accessed, managed, and delivered. The organization strives to create a future where technology enables faster, safer, and more efficient healthcare for all.

LEARNING OBJECTIVES

The following learning objectives were formally defined at the commencement of the internship and served as a roadmap for skill development throughout the engagement:

- To understand the fundamentals of backend architecture and system design using **Python, Celery and Django**.
- To develop RESTful APIs for real-world healthcare applications using **DRF**.
- To gain experience in database modeling and management using **SQLite**.
- To implement secure authentication and authorization mechanisms using **JWT** and **RBAC**.
- To design and develop a **Credential Manager System** for secure handling of user credentials and access permissions.
- To apply best practices for data security, including password encryption using libraries like **bcrypt**.
- To gain hands-on experience in API testing and debugging using tools such as **Postman** and Django's **built-in testing framework**, ensuring reliability and correctness of backend services.
- To gain experience in version control and collaborative development using **Git** and **GitHub**.
- To improve performance and scalability of backend systems through efficient query design and optimized API responses
- To develop problem-solving skills and logical thinking in backend development within a real-world healthcare system.

COMPANY CULTURE

The work culture at KYNOBY AI is centered around collaboration, innovation, and continuous learning. Interns are encouraged to take ownership of their tasks and actively participate in problem-solving rather than passively following instructions.

The organization promotes a hands-on learning environment where real-world challenges are assigned, and interns are expected to design and implement solutions independently, with guidance from mentors when needed. Regular discussions and reviews help in improving both technical and analytical skills.

Team members at KYNOBY AI are highly supportive and maintain an open communication environment, making it easier to ask questions, share ideas, and learn new technologies. The culture emphasizes writing clean, efficient, and maintainable code, which aligns with industry standards.

.

SCOPE OF THE INTERNSHIP

The internship was structured as a **six-week** engagement, with each week dedicated to a specific phase of the analytical project. The broad scope of activities included:

1. **Week 1:** Introduction to KYNOBY AI, understanding healthcare system requirements, and learning backend fundamentals using Django and REST APIs.
2. **Week 2:** Designing system architecture and database schema for the Credential Manager System, including entities like User, Credential, and Assignment.
3. **Week 3:** Implementing database models and configuring the Django Admin Panel for managing data and performing CRUD operations.
4. **Week 4:** Developing RESTful APIs for credential management, assignment handling, and user-related operations using Django REST Framework.

5. **Week 5:** Implementing security features such as password encryption, role-based access control, and audit logging mechanisms.
6. **Week 6:** Testing APIs using Postman and Django tools, handling edge cases, debugging issues, and preparing documentation and final report.

TECHNOLOGIES USED DURING INTERNSHIP

Figure 2.1: Technologies and Libraries Used During the Internship

The internship demanded proficiency in a wide range of technologies encompassing backend development, database design, API engineering, and security practices in a healthcare-driven environment. Each technology contributed significantly to the development of a robust and secure Credential Manager System, enabling efficient system functionality, structured data management, and strict protection of sensitive healthcare data.

PYTHON PROGRAMMING LANGUAGE

Python served as the primary programming language throughout the internship. Its simplicity, readability, and extensive ecosystem make it an ideal choice for backend development. Python enabled rapid development of server-side logic and seamless integration with frameworks such as Django.

The interpreted nature of Python allowed for quick testing and debugging, which was particularly useful during API development and system validation phases.

DJANGO FRAMEWORK

Django was used as the core backend framework for building the application. It follows the Model-View-Template (MVT) architecture, which promotes clean separation of concerns and efficient code organization.

Django provided built-in functionalities such as ORM (Object Relational Mapping), authentication, and admin panel support, significantly reducing development time and ensuring a structured backend system.

DJANGO REST FRAMEWORK (DRF)

Django REST Framework was used to develop RESTful APIs for communication between the frontend and backend systems. It provided tools such as serializers, API views, and response handling, enabling efficient API creation.

DRF ensured that APIs followed standard formats and supported operations such as GET, POST, PATCH, and DELETE, which were essential for managing credentials and assignments.

MYSQL DATABASE

MySQL was used as the relational database for storing application data. It was responsible for managing structured data such as users, credentials, assignments, and audit logs.

The use of relational tables and foreign key relationships ensured data integrity and consistency. MySQL also supported efficient querying, which improved the performance of backend operations.

POSTMAN

Postman was used for testing and validating API endpoints. It allowed sending HTTP requests and analyzing responses during development.

Through Postman, various scenarios such as credential creation, assignment, updating, and deletion were tested to ensure correctness and reliability of the system.

JWT AUTHENTICATION

JWT was used to implement secure authentication. It allowed users to access protected APIs through token-based authentication rather than session-based methods.

This ensured that only authorized users could perform sensitive operations, which is critical in healthcare systems where data privacy is essential.

GIT AND GITHUB

Git was used for version control, allowing tracking of code changes and maintaining project history. GitHub was used as a remote repository for storing and managing the project code.

These tools enabled better collaboration, code backup, and efficient development workflow.

DJANGO ADMIN PANEL

The Django Admin Panel was used for managing application data through a graphical interface. It allowed performing CRUD (Create, Read, Update, Delete) operations on models such as users, credentials, and assignments.

The admin panel provided a quick and efficient way to test database operations without relying solely on APIs.

SYSTEM DESIGN AND ARCHITECTURE

PROBLEM UNDERSTANDING

The healthcare domain involves handling highly sensitive data such as user credentials, system access details, and confidential information. Managing such data securely while ensuring controlled access is a critical challenge.

The primary objective of this project was to design and develop a **Credential Manager System** that enables secure storage, management, and assignment of credentials across multiple users and instances. The system needed to ensure that credentials are not directly exposed, and access is granted only through controlled assignment mechanisms.

Additionally, the system was required to support multiple users with different roles, enforce strict access control policies, and maintain a detailed audit trail of all operations. This ensures accountability, traceability, and compliance with healthcare data security standards.

Figure 3.1: Problem Overview Diagram

CONSTRAINTS AND BUSINESS RULES

To ensure system reliability and security, several constraints and business rules were defined and implemented:

- A credential can be assigned to only one user at a time
- A user can hold only one credential per instance
- Credentials must remain secure and passwords should never be exposed through APIs
- Assignment is mandatory for accessing credentials
- Deleting a credential automatically revokes any existing assignment
- All critical operations must be recorded in audit logs

These rules ensure consistency, prevent unauthorized access, and maintain data integrity across the system.

Table 3.1: Database Architecture Overview

SYSTEM ARCHITECTURE OVERVIEW

The system follows a layered architecture consisting of frontend, backend, and database components. The frontend interacts with the backend through RESTful APIs. The backend, built using Django and Django REST Framework, processes requests, applies business logic, and communicates with the database. The database stores structured data such as users, credentials, assignments, and audit logs.

This architecture ensures scalability, modularity, and separation of concerns. It also allows secure handling of requests and responses, which is essential in healthcare applications:

DATABASE DESIGN

The database design plays a crucial role in ensuring data integrity and efficient system operations. The system was designed using a relational database structure with clearly defined entities and relationships.

The key entities include:

- **User:** Represents system users
- **Credential:** Stores account-related information
- **Assignment:** Links users with credentials
- **Audit Log:** Tracks all system activities

Relationships between these entities were defined using foreign keys to maintain consistency and enforce constraints. Proper indexing and structured schema design ensured efficient querying and performance.

auth_user	Data type	\$ Key	
id	INT	PRI	
username	VARCHAR		
email	INT	PRI	
credential_manager_assignment	INT	PRI	
id user_id	VARCHAR		
id credential_id (FK)	VARCHAR		
credential_manager_auditlog	INT	MUL	
id user_id (FK)	VARCHAR		
id credential_manager credential	INT	PRI	

Table 3.2: Database Tables

BACKEND IMPLEMENTATION

DATABASE MODEL DESIGN

The foundation of the Credential Manager System lies in its database design. The system was implemented using Django's Object Relational Mapping (ORM), which allowed defining database tables as Python classes.

The primary models designed in the system include:

- **User Model:** Stores user-related information such as username, email, and role
- **Credential Model:** Stores account credentials including instance ID, username, and encrypted password
- **Assignment Model:** Establishes a relationship between users and credentials
- **Audit Log Model:** Tracks all system activities such as creation, assignment, updates, and deletions

Relationships between models were implemented using foreign keys to maintain referential integrity. Constraints such as one-to-one credential assignment and instance-based restrictions were enforced at the database level to ensure data consistency.

```
> class Credential(models.Model): ...  
  
# Assignment container per user  
> class CredentialAssignment(models.Model): ...  
  
# Assignment container per user  
> class CredentialAssignmentLink(models.Model): ...  
  
# Audit Log  
> class AuditLog(models.Model): ...
```

Figure 4.1: Models (Database)

DJANGO ADMIN CONFIGURATION

The Django Admin Panel was configured to manage application data efficiently through a user-friendly interface. It provided a quick way to perform CRUD (Create, Read, Update, Delete) operations on database records without directly interacting with APIs.

Customizations were made to display relevant fields such as credential status, assigned user, and timestamps. Filters and search functionality were also enabled to improve usability.

The admin panel was particularly useful during development for testing data flow, verifying relationships, and ensuring that constraints were correctly enforced.

Figure 4.2: Django Administration

API DESIGN AND DEVELOPMENT

The backend APIs were developed using Django REST Framework (DRF), enabling communication between the frontend and backend systems. The APIs were designed following REST principles and supported standard HTTP methods such as GET, POST, PATCH, and DELETE.

All APIs were structured to return responses in a consistent format, ensuring clarity and ease of integration with the frontend. Security measures such as authentication and validation were applied to protect sensitive data.

CREDENTIAL APIS

These APIs were responsible for managing credential-related operations:

- Creating new credentials
- Deleting existing credentials
- Updating passwords securely

The system ensured that passwords were encrypted and never returned in API responses. Credentials could optionally be assigned to users during creation.

Select credential to change ADD CREDENTIAL +

4 credentials

Figure 4.3: Credentials

USER APIS

User APIs were used to retrieve system users, primarily for assignment purposes. These APIs provided essential user details required for mapping credentials.

ASSIGNMENT APIS

Assignment APIs handled the linking of credentials to users:

- Assigning a credential to a user
- Updating an existing assignment
- Revoking assignments

The system ensured that a credential could only be assigned to one user at a time and enforced all assignment constraints

Select credential assignment to change ADD CREDENTIAL ASSIGNMENT +

Figure 4.4: Credential Assignment

AUDIT LOG APIS

Audit log APIs were implemented to track all critical system activities. These logs included actions such as credential creation, assignment updates, password changes, and deletions.

This ensured transparency, accountability, and traceability within the system, which is essential in healthcare applications

API TESTING AND VALIDATION

TESTING USING DJANGO TESTING FRAMEWORK

API testing was performed using Django's built-in testing framework, which provides a structured and efficient way to validate backend functionality. The Django TestCase class and test client were used to simulate HTTP requests and verify API responses.

Test cases were written for different endpoints to ensure correct behavior for operations such as credential creation, assignment handling, password updates, and data retrieval. The Django test client allowed sending GET, POST, PATCH, and DELETE requests directly within the testing environment.

This approach ensured that APIs were thoroughly tested in an isolated environment without affecting the production database. It also enabled automated testing, making it easier to identify and fix issues during development.

Figure 5.1: Testing Get Endpoint

EDGE CASE HANDLING

To ensure system robustness, various edge cases were identified and handled during testing.

Some of the key edge cases include:

- Attempting to assign a credential that is already assigned to another user
- Assigning multiple credentials of the same instance to a single user
- Deleting a credential that is currently assigned
- Providing invalid or missing input data
- Accessing APIs with incorrect parameters

These cases were tested using Django test cases, and appropriate validation logic was implemented to return meaningful error responses. This ensured that the system behaves predictably under all conditions.

Figure 5.2: Edge Case Handling

SECURITY AND VALIDATION CHECKS

Security and validation were critical components of the testing process, especially in a healthcare environment where sensitive data is involved.

The following checks were implemented and tested:

- Passwords are securely stored and never exposed in API responses
- Authentication is required to access protected endpoints
- Input validation prevents incorrect or malicious data from being processed
- Role-based access control ensures restricted access to sensitive operations
- Audit logs are generated for all critical actions

Django's testing framework was used to validate these security measures by simulating both authorized and unauthorized requests.

Figure 5.3: Authentication

SYSTEM FEATURES AND FUNCTIONALITY

CREDENTIAL MANAGEMENT

The Credential Manager System provides a secure and efficient way to manage credentials across multiple instances. It allows creation, deletion, and updating of credentials while ensuring that sensitive data such as passwords is protected.

Each credential is associated with an instance and stored securely in the database. Passwords are encrypted before storage and are never exposed through API responses. The system also maintains the status of each credential, such as assigned or unassigned, to track its availability.

This feature ensures centralized management of credentials while maintaining security and data integrity.

ROLE-BASED ACCESS CONTROL

The system implements Role-Based Access Control (RBAC) to ensure that users can only access functionalities based on their roles.

Two primary roles are defined:

- **Manager:** Has full access to all system operations, including credential creation, assignment, and audit logs
- **Staff:** Has limited access, primarily restricted to viewing assigned credentials

This mechanism ensures that sensitive operations are only performed by authorized users, enhancing system security and control.

ASSIGNMENT MANAGEMENT

Assignment management is a core feature of the system, responsible for linking credentials to users. It ensures controlled access to credentials through a structured assignment mechanism.

The system allows assigning, updating, and revoking credentials. It enforces strict constraints such as allowing only one user per credential and preventing multiple credentials of the same instance from being assigned to a single user.

Automatic updates are triggered when assignments are modified, such as updating credential status or removing assignments when credentials are deleted.

Select credential assignment link to change
ADD CREDENTIAL ASSIGNMENT LINK +

4 credential assignment links

Figure 6.1: Assignment Links

AUDIT LOGGING SYSTEM

The audit logging system records all critical operations performed within the system. This includes actions such as credential creation, assignment updates, password changes, and deletions.

Each log entry contains details such as the user performing the action, the type of action, and the timestamp. This ensures complete traceability and accountability within the system.

Audit logs are essential in healthcare applications where monitoring and compliance are critical.

Figure 6.2: Audit Logs(History)

RESULTS AND OUTPUT

API RESPONSE OUTPUTS

The developed system successfully generated structured and consistent API responses for all operations. Each API returned responses in a standardized format containing status, message, and relevant data.

For example, operations such as credential creation, assignment, and deletion returned clear success messages along with required data, while error cases returned appropriate validation messages.

The responses were designed to be easily understandable and directly usable by frontend applications. Sensitive information such as passwords was never included in API outputs, ensuring security.

SYSTEM PERFORMANCE AND EFFICIENCY

The system demonstrated efficient performance in handling API requests and database operations. The use of Django ORM and optimized database queries ensured fast data retrieval and updates.

The modular backend architecture allowed smooth handling of multiple operations such as credential management and assignment processing without performance degradation.

Additionally, validation checks and constraints were implemented efficiently, ensuring that incorrect operations were handled without affecting system stability.

The system is scalable and can be extended to support larger datasets and more complex workflows in real-world healthcare applications

KEY ACHIEVEMENTS

The internship project achieved the following key outcomes:

- Successfully designed and implemented a secure **Credential Manager System**
- Developed fully functional REST APIs for credential and assignment management
- Ensured data security through encryption and restricted API responses

- Implemented role-based access control for secure system usage
- Designed a structured database with proper relationships and constraints
- Integrated audit logging for tracking all critical system activities
- Performed comprehensive testing using Django's testing framework
- Successfully deployed the Credential Manager System, which is currently **live and actively in use**
- The system has demonstrated reliable performance in real-world scenarios and is **functioning efficiently without major issues**
- Received **positive feedback and strong reviews** for its usability, security, and performance
- The project is being further extended with the development of a **dedicated frontend interface**, indicating its scalability and future growth.

Figure 7.1: Frontend for Credential Manager

CONCLUSION

SUMMARY OF WORK ACCOMPLISHED

This internship at **KYNOBY AI** as a Backend Engineer provided comprehensive exposure to real-world backend development within a healthcare environment. The primary objective of designing and developing a **Credential Manager System** was successfully achieved.

The project involved end-to-end backend development, including system design, database modeling, API development, security implementation, and testing. A robust and scalable system was built to securely manage credentials, enforce access control, and maintain audit logs.

The successful deployment of the system, along with its active usage in real-world scenarios, demonstrates the practical applicability and effectiveness of the developed solution.

Key Learnings

Throughout the internship, several important technical and professional learnings were gained:

- Understanding real-world backend architecture and system design
- Developing RESTful APIs using Django REST Framework
- Designing relational databases with proper constraints and relationships
- Implementing secure systems with encryption and role-based access control
- Handling edge cases and ensuring system reliability
- Testing backend systems using Django's built-in testing framework
- Gaining experience in building scalable and production-ready applications
- Improving problem-solving skills and debugging capabilities

FUTURE WORK

While the system is fully functional, there are several areas for further enhancement:

- Development of a complete frontend interface for improved user interaction
- Integration of advanced authentication mechanisms such as multi-factor authentication
- Performance optimization for handling larger datasets and increased user load
- Implementation of real-time notifications for assignment updates
- Extension of the system to support additional healthcare workflows

CLOSING REMARKS

The internship experience at **KYNOBY AI** has been highly valuable in bridging the gap between academic knowledge and practical implementation. Working on a real-world healthcare system provided deep insights into the importance of secure, scalable, and efficient backend development.

The experience has significantly strengthened my technical skills and confidence in building production-level systems. The knowledge and hands-on experience gained during this internship will serve as a strong foundation for my future career in software development.

APPENDIX

16

71-75 Shelton Street, Covent Garden, London, United Kingdom, WC2H 9JQ

Shaikh Md Zaid, Bharuch, India

Subject: Offer of Employment

Dear Shaikh Md Zaid,

I am pleased to offer you the position of **Developer (Intern)** at KYNoby, reporting to **Moh Reza**. We were highly impressed with your skills and experience, and we are excited about the contributions you will bring to our team.

Below are the details of your employment:

Position: Developer

Grade: Intern

Start Date: 09/01/2026

Employment Type: Full-Time

Work Location: Remote

Salary: 10,000 INR per Month

Benefits: 15 Days Holiday per Annum + UK Bank Holidays

Your employment will be subject to the terms and conditions outlined in the company's policies and your formal contract of employment, which will be provided to you upon your acceptance of this offer. Please note that this offer is contingent upon the successful completion of any required background checks and reference verifications.

After 3 months of successful performance at the Intern level, you will be automatically eligible for promotion to Apprenticeship level and a revised salary increase.

To accept this offer, please sign and return a copy of this letter. Should you have any questions, feel free to reach out to us.

We are thrilled to have you join KYNOBY and look forward to working together to achieve great things.

Best regards,

Faizal Ali
Founder & CEO
KYNOBY

Acceptance of Offer

I, **Shaikh Md Zaid**, accept the offer for the position of Developer at **KYNOBY** under the terms outlined above.

Signature: _____

Date: _____

KYNOBY

INTERNSHIP ATTENDANCE LOG

Student Daily Diary / Log

Name of the student: Shaikh Mohammed Zaid (220140107065)

Date	Day	Name of Completed Task	Work of the Day	Sign of Industry Supervisor
13/01/2026	Tuesday	Backend Repository Access	Received access to the Kynoby backend repository on GitHub. Explored the repository structure and understood the project layout including Django apps, configuration files, and API structure.	
14/01/2026	Wednesday	Backend Setup and Environment Configuration	Cloned the backend repository locally using Git. Installed project dependencies using requirements.txt. Received the .env configuration file and configured environment variables required for running the Django backend.	
15/01/2026	Thursday	Local Backend Initialization	Set up the virtual environment and configured the Django project locally. Ran migrations and started the development server. Verified that the backend APIs were accessible locally.	
16/01/2026	Friday	Introduction to Django REST Framework	Studied the fundamentals of Django REST Framework including APIView, ModelSerializer, request/response handling, and API routing. Understood how DRF is used to build RESTful APIs in the backend.	

19/01/2026	Monday	Understanding Backend Project Structure	Explored the overall backend architecture and folder structure. Studied important files such as models.py, views.py, serializers.py, and urls.py. Understood how Django apps are organized within the project.	
20/01/2026	Tuesday	Exploring gp_assist Module	Started analyzing the gp_assist module which handles document processing and AI assistance features. Reviewed models.py to understand how database models are structured for storing processed documents and related information.	
21/01/2026	Wednesday	Understanding API Endpoints	Studied API endpoints defined in views.py. Learned how APIView classes handle HTTP requests and responses. Observed how request data is validated and processed before interacting with the database.	
22/01/2026	Thursday	Studying Serializers	Explored serializers.py and understood the use of ModelSerializer for converting model instances to JSON and validating incoming API data. Learned how serializers connect models and API views.	
23/01/2026	Friday	Understanding Database Models	Studied models.py in detail to understand database schema design. Reviewed how models represent backend	

			entities and how Django ORM is used for database operations.	
26/01/2026	Monday	Understanding Document Processing Logic	Explored document processing related components such as PDFProcessor and LetterProcessor. Understood how uploaded documents are parsed, text is extracted, and prepared for further processing.	
27/01/2026	Tuesday	Backend Codebase Review	Continued reviewing backend code including utility functions, request handling logic, and API integration flow. Consolidated understanding of how serializers, views, models, and processors interact in the system.	
28/01/2026	Wednesday	Introduction to Celery	Started learning about Celery and its role in asynchronous task processing in Django applications. Studied how Celery helps handle background tasks such as long-running computations without blocking the main request-response cycle.	
29/01/2026	Thursday	Celery Architecture and Concepts	Learned about Celery architecture including task queues, workers, brokers, and message passing. Understood how asynchronous workers execute tasks separately from the main Django server.	

30/01/2026	Friday	Integrating Celery with Django	Explored how Celery integrates with Django projects. Studied configuration files, task definitions, and how background tasks are triggered from Django views and services.	
02/02/2026	Monday	Understanding Celery Beat	Learned about Celery Beat and its role in scheduling periodic tasks in Django applications. Studied how scheduled jobs can be configured to run automatically at defined intervals.	
03/02/2026	Tuesday	Celery Beat Scheduling	Explored how periodic tasks are defined using Celery Beat schedules. Understood how scheduled jobs help automate background processes in backend systems.	
04/02/2026	Wednesday	Backend Performance Optimization Concepts	Discussed backend performance considerations with the team. Learned about the drawbacks of sending large datasets directly to the frontend and why optimized API responses are necessary for scalable applications.	
05/02/2026	Thursday	Designing API Endpoints for Graph Data	Started implementing backend endpoints to support graph visualization in the frontend. Designed API responses that return structured data suitable for chart rendering.	

06/02/2026	Friday	Implementing Paginated Graph APIs	Implemented API endpoints that return paginated data instead of sending complete datasets. Learned how pagination improves performance and reduces API response time.	
09/02/2026	Monday	Backend Pagination Implementation	Applied pagination techniques in Django REST Framework to control the volume of data sent to the frontend. Configured pagination to ensure efficient data transfer.	
10/02/2026	Tuesday	Creating Graph Data APIs	Developed multiple backend endpoints to supply graph-related data for frontend dashboards. Ensured the endpoints returned structured responses optimized for chart rendering.	
11/02/2026	Wednesday	API Optimization for Frontend Integration	Worked on refining API responses to ensure the frontend could retrieve data smoothly for graph visualization. Tested endpoints to confirm correct pagination and response format.	
12/02/2026	Thursday	Latency Reduction through Backend Optimization	Verified that paginated APIs reduced response size and improved backend performance. Understood how optimized APIs decrease latency and improve user experience.	

13/02/2026	Friday	Testing and Validation of Graph APIs	Tested the implemented endpoints using API testing tools to ensure correct data retrieval and pagination behavior. Validated responses used for frontend graph components.	
16/02/2026	Monday	Requirement Analysis for Credential Manager	Discussed requirements with the supervisor for developing a credential management system. Understood the objective, expected functionality, authentication mechanism using JWT, and the overall backend workflow.	
17/02/2026	Tuesday	System Design and Planning	Analyzed the requirements and conceptualized the working of the credential manager. Planned database structure, API endpoints, and authentication flow. Created a rough architecture of how credentials would be managed and accessed securely.	
18/02/2026	Wednesday	Developing Initial Demo Version	Implemented the first demo version of the credential manager module. Developed basic functionality to store and retrieve credentials using a temporary dummy database setup.	
19/02/2026	Thursday	Debugging Demo Implementation	Tested the demo implementation and identified issues in the logic and API responses. Fixed initial bugs and	

			improved the functionality of the demo credential manager.	
20/02/2026	Friday	Feature Enhancements	Added additional features to the credential manager based on supervisor feedback. Improved data handling and refined API responses to make the system more reliable.	
23/02/2026	Monday	Finalizing Demo Version	Completed the working demo version of the credential manager and ensured that the core functionality was stable. Demonstrated the system workflow and prepared it for backend integration.	
24/02/2026	Tuesday	Backend Integration Preparation	Started integrating the credential manager into the existing backend system. Removed the dummy database logic and prepared the module to use the main backend database.	
25/02/2026	Wednesday	Branch Creation and Backend Integration	Created a new Git branch from the main backend repository and began integrating the credential manager module into the existing backend architecture.	
26/02/2026	Thursday	Debugging Backend Integration	Encountered integration issues while connecting the credential manager with the backend models and APIs. Debugged and resolved several issues to stabilize the integration.	

27/02/2026	Friday	Code Review Improvements	Implemented serializer separation for different API operations, on senior's suggestion after code review	
02/03/2026	Monday	Converting Functional Views to Class-Based Views	Refactored the codebase by converting functional view implementations into Django REST Framework class-based views. Improved code structure and readability.	
03/03/2026	Tuesday	Admin Panel and API Improvements	Implemented the admin panel configuration for credential management and refined API endpoints to ensure proper functionality and maintainability.	
04/03/2026	Wednesday	Migration Cleanup and Code Optimization	Cleaned up unnecessary migration files and optimized the codebase to maintain minimal and efficient commits before pushing changes to the repository.	
05/03/2026	Thursday	Advanced Git Operations and Branch Rebase	Learned advanced Git concepts including rebasing. Rebased the working branch from the main branch to the staging branch as per project workflow requirements.	
06/03/2026	Friday	Pull Request Submission	Created a pull request from the updated branch to the staging branch. Submitted the credential manager implementation for review by the senior development team.	

09/03/2026	Monday	Klinik API Development	Started working on backend APIs for Klinik system. Developed APIs such as rpa_stats to provide structured analytics data for frontend usage.	
10/03/2026	Tuesday	Additional API Development	Continued building multiple backend APIs required for Klinik dashboards. Ensured proper response structure and optimized data handling.	
11/03/2026	Wednesday	API Refinement	Improved existing APIs and ensured compatibility with frontend requirements. Focused on clean response formats and performance.	
12/03/2026	Thursday	Transformation Logs Planning	Began designing transformation logs system. Understood requirement for logging backend processing steps and tracking execution history.	
13/03/2026	Friday	Transformation Logs Architecture	Started creating architecture for transformation logs including structure for storing logs and processing runs.	
16/03/2026	Monday	Database Design for Logs	Created database models ProcessingRun and ProcessingLogEntry for storing execution logs and individual log entries.	
17/03/2026	Tuesday	Logs API Development	Developed APIs for transformation logs. Implemented core endpoints for storing and retrieving logs.	
18/03/2026	Wednesday	Logs API Enhancement	Implemented save_logs, delete_logs, and get_logs APIs. Ensured proper request handling and validation.	

19/03/2026	Thursday	Logs Optimization	Refined transformation logs APIs for better performance and structured logging.	
20/03/2026	Friday	Logs System Testing	Tested transformation logs functionality and validated correct storage and retrieval of logs.	
23/03/2026	Monday	Credential Frontend APIs	Developed APIs required for frontend integration of credential assignment.	
24/03/2026	Tuesday	Credential API Refinement	Improved credential APIs for better usability and response structure.	
25/03/2026	Wednesday	API Integration	Ensured seamless integration between credential APIs and frontend requirements.	
26/03/2026	Thursday	Backend Improvements	Performed general backend improvements and bug fixes in APIs.	
27/03/2026	Friday	Code Cleanup	Refactored and cleaned up backend code for maintainability.	
30/03/2026	Monday	Logs System Enhancement	Made improvements to transformation logs and ensured stability in API behavior.	
31/03/2026	Tuesday	Logs API Testing	Conducted additional testing and debugging of logs APIs.	
01/04/2026	Wednesday	API Enhancements	Worked on refining backend APIs and improving data handling logic.	
02/04/2026	Thursday	Pre-Deployment Fixes	Fixed issues and prepared APIs for stable usage.	
06/04/2026	Monday	Urgent API Development	Created API for fetching unique letter_type values.	
07/04/2026	Tuesday	Backend Modifications	Made changes to transformation logs and committed updates. Added letter_type filter	

			in PBI report APIs and updated insts endpoint to include entity_name.	
08/04/2026	Wednesday	Credential APIs (Detailed)	Developed complete set of credential manager APIs for frontend. Implemented separate CRUD APIs for Credentials and Assignments.	
09/04/2026	Thursday	Configuration System Design	Designed models and endpoints for storing configurations. Implemented scalable architecture using Config → Section → Field models for dynamic backend configurations.	
10/04/2026	Friday	Advanced Architecture Design	Designed multi-layered architecture for configuration system based on priority handling. Analyzed trade-offs of moving configuration storage from frontend to backend.	
13/04/2026	Monday	System Recovery and Setup	Faced Ubuntu crash leading to data loss. Reinstalled Ubuntu and restored project files including Klinik and backend repositories.	
14/04/2026	Tuesday	Environment Restoration	Reconfigured development environment and ensured backend setup was working correctly after recovery.	
15/04/2026	Wednesday	Backend Stabilization	Verified APIs and backend functionality after system restoration. Fixed minor issues caused due to environment reset.	
16/04/2026	Thursday	Final API Testing	Tested all implemented APIs including logs, credentials, and configurations to ensure stability.	

17/04/2026	Friday	Code Review Preparation	Reviewed all implemented features, cleaned codebase, and prepared work for final review and integration.

NAME OF THE ORGANISATION: KYNOBY AI

NAME OF THE PLANT/SECTION/DEPARTMENT: BACKEND DEVELOPMENT

NAME OF OFFICER INCHARGE OF THE PLANT/SECTION/DEPARTMENT: MOH ABDELRAZAK

DESCRIPTION OF THE WORK DONE IN BRIEF

- Developed multiple APIs for graph visualization.
- Optimized API response size and reduced latency.
- Tested paginated APIs for frontend integration.
- Improved backend response structure for analytics dashboards.
- Learned about frontend-backend integration

GUJARAT TECHNOLOGICAL UNIVERSITY

NAME OF OFFICER INCHARGE OF THE PLANT/SECTION/DEPARTMENT: MOH ABDELRAZAK

DESCRIPTION OF THE WORK DONE IN BRIEF

- Improved serial communication handling and desktop IDE performance.
- Created ProcessingRun and ProcessingLogEntry models.
- Developed transformation log APIs.
- Learned about database modeling and architected various schemas.
- Implemented:
 1. save_logs
 2. delete_logs
 3. get_logs
- Tested logging workflow.

NAME OF OFFICER INCHARGE OF THE PLANT/SECTION/DEPARTMENT: MOH ABDELRAZAK

DESCRIPTION OF THE WORK DONE IN BRIEF

- Created API for unique letter_type.
- Added filters to PBI Reports APIs.
- Added entity_name support in endpoints.
- Created CRUD APIs for credential management.
- Designed scalable configuration architecture:
 1. Config
 2. Section
 3. Field models
- Planned multi-layered configuration system.

Feedback Form by Industry expert

Student Name:

Date:

Work Supervisor:

Title:

Company/Organization:

Enrollment No:

Internship Address:

Dates of Internship: From _____ to _____

Please evaluate your intern by indicating the frequency with which you observed the following behaviors:

Parameters	Needs improvement	Satisfactory	Good	Excellent
Shows interest in work and his/her initiatives				
Produces high quality work and accepts responsibility				
Uses technical knowledge and expertise				
Analyzes problems effectively				
Communicates well and writes effectively				

Overall performance of student intern: (Needs improvement/ Satisfactory/Good/Excellent):

Additional comments, if any:

Signature of Industry person with name and Stamp:

Signature of the Faculty Mentor
